1.1.3. Days between Two Dates

05:19

Write a Python program to calculate number of days between two dates.

Input Format:

- The first line contains the first date in the format .
- The second line contains the second date in the format .

Output Format:

- An integer representing the number of days between the given dates.

Note:

- The first date should always be considered earlier than the second date.

```
from datetime import date
date1_input = input().strip()
date2_input = input().strip()
y1, m1, d1 = map(int, date1_input.split('-'))
y2, m2, d2 = map(int, date2_input.split('-'))
date1 = date(y1, m1, d1)
date2 = date(y2, m2, d2)
difference = date2 - date1
print(difference.days)
```

The screenshot displays a code editor with a Python script and a test runner interface. The code calculates the difference in days between two dates entered by the user. The test runner shows two test cases, both of which passed.

Code Editor:

```
1 from datetime import date
2 date1_input = input().strip()
3 date2_input = input().strip()
4 y1, m1, d1 = map(int, date1_input.split('-'))
5 y2, m2, d2 = map(int, date2_input.split('-'))
6 date1 = date(y1, m1, d1)
7 date2 = date(y2, m2, d2)
8 difference = date2 - date1
9 print(difference.days)
```

Test Runner:

Average time: 0.007 s (7.25 ms) | Maximum time: 0.010 s (10.00 ms) | 2 out of 2 shown test case(s) passed | 2 out of 2 hidden test case(s) passed

Test case 1 (10 ms):

Expected output	Actual output
2014-07-02	2014-07-02
2014-11-02	2014-11-02
123	123

Test case 2 (6 ms):

Expected output	Actual output
2014-07-02	2014-07-02
2014-07-11	2014-07-11
9	9
